

Your child uses AI every single day.

But do they know these 7 terms? Class 5–10. All of them should know these.

Algorithm

A set of instructions that tells a computer what to do — step by step.

Student version: "The recipe AI follows to make decisions."

Neural Network

A system that loosely mimics the human brain — layers of connected nodes that process information.

Student version: "AI's brain — made of connected layers that learn from examples."

Training Data

The examples used to teach AI how to recognize patterns.

Student version: "The textbook AI studies from."

Bias in AI

When AI reflects unfair patterns from its training data.

Example: An AI trained mostly on male doctors' data might perform worse for female patients.

Student version: "When AI learns the wrong lessons from bad examples."

Large Language Model (LLM)

AI trained on massive amounts of text to understand and generate language.  Generative AI AI that creates new content — text, images, video, code — based on patterns it learned.

Student version: "An AI that read the entire internet and learned to speak."

Student version: "AI that makes new things, not just finds old ones."

Inference

When AI uses what it learned to respond to new inputs — the "thinking" phase.

- 1. Algorithm — AI's recipe**
- 2. Neural Network — AI's brain**
- 3. Training Data — AI's textbook**
- 4. Bias — AI's wrong lessons**
- 5. LLM — AI that read the internet**
- 6. Generative AI — AI that creates**
- 7. Inference — AI thinking live**

Student version: "When AI actually uses its brain to answer your question."

Quick recap:
